

WHO's anti-vaping scientific castle of cards toppled

Toppled!

Updated 9 November with [*UKCTAS report translations*](#)

The UK Centre for Tobacco and Alcohol Studies ([UKCTAS](#)) has produced a devastating critique of the WHO paper on 'Electronic Nicotine Delivery Systems' (e-cigarettes or vaping products to everyone else). The paper by WHO is for the [7th Conference of the Parties to WHO's tobacco control treaty, the Framework Convention on Tobacco Control](#), (FCTC COP-7) which will be held in Delhi 7-12 November, 2016.

A tremendous effort by the authors John Britton, Ann McNeill, Linda Bauld and Ilze Bogdanovica, and the reviewers (disclosure: I was a reviewer).

The report speaks for itself, so here are the relevant links to the report, some unofficial translations and the executive summary.

- UKCTAS press release (26 Oct): [Highly critical report: UK experts say WHO needs better understanding of the evidence on e-cigarettes to inform its international tobacco control treaty](#)

Please help to disseminate this report. Either send to your own contacts before or during COP-7 or if you have suggestions for relevant officials or influential people this could be sent to, please email me or directly or via [the contact form](#) and provide their name, title, institution and email address. I'm not chasing email addresses.

Translations of UKCTAS critique to UN languages

Called in some favours and here we have some unofficial translations from the English text:

- Arabic: [Executive summary](#) /
- Chinese: [Executive summary](#) / [Full report](#)
- English: [Executive summary](#) / [Full report](#)
- French: [Executive summary](#) / [Full report](#)
- Spanish: [Executive summary](#) / [Full report](#)
- Russian: [Executive summary](#) / [Full report](#)

These are available on an 'as is' basis - I am unable to vouch for the accuracy of the translation and they are not official UKCTAS documents.

UKCTAS critique executive summary text

The text below is the executive summary from the UKCTAS report (i.e. not my summary). Please visit the links above to see the detailed criticisms behind these

summary points.

Commentary on WHO report on Electronic Nicotine Delivery Systems and Electronic Non-Nicotine Delivery Systems

EXECUTIVE SUMMARY

- **Positioning ENDS as a threat rather than opportunity.** Overall, the WHO report does not correctly position ENDS primarily as an alternative to smoking and instead focusses excessively on risks of ENDS use without adequately recognising the deep reductions in health risks when a smoker switches to ENDS. The FCTC itself recognises ‘harm reduction’ as a key strategy in tobacco control. But with minor exceptions, the WHO report discusses ENDS as a threat, whereas in fact they represent a major opportunity for public health.
- **Failure to quantify risk.** The WHO paper provides a poor assessment of ENDS risks. In terms of toxicology, the discussion is naïve and places excessive emphasis on negligible risks arising from very low exposures. In toxicology, the presence of a potentially harmful agent does not necessarily establish a material risk. This is because the level of exposure matters and “the dose makes the poison”.
- **Inadequate comparisons with smoking.** The WHO paper does not systematically make meaningful comparisons with exposures arising from inhaling tobacco smoke or refer to other useful comparators such as occupational exposure limits. However, data from around the world shows that almost all ENDS users are smokers, ex-smokers or would-be smokers. The most relevant comparison for health policy purposes is with smoking.
- **Misrepresenting second hand ENDS vapour risks.** The section on risks of second-hand exposure to ENDS aerosol provides no evidence that such exposures pose any material risks to bystanders. The claim that ENDS have the “potential to lead to adverse health effects” in bystanders does not reflect the science behind the cited source unless ‘potential’ is taken to mean any exposure, no matter how trivial. Again, the issue is not the presence of particular chemicals, but the magnitude of exposure.
- **Discounting the evidence that ENDS do help smokers quit.** The WHO paper does not properly assess the role that ENDS play in

quitting smoking and uncritically repeats a number of methodological errors found in the literature. Taking the totality of evidence including controlled trials, observational studies, changes in population smoking and ENDS use, the experience of nicotine replacement therapy, and widely reported user experience, there is confidence that ENDS are helping many smokers to quit smoking and not having negative effects like renormalising smoking, reducing quit rates or creating gateway effects.

- **ENDS marketing can be anti-smoking advertising.** The vast majority of ENDS marketing is truthful promotion of a low-risk alternative to smoking and targeted at adult smokers. The evidence cited by WHO has been misrepresented and does not make the case for any systematic malpractice by ENDS vendors. However, the WHO paper overlooks that most fundamental point, which is that ENDS marketing is promoting an alternative to smoking and may therefore be promoting desirable changes in smoking behaviour. It may also reach people who do not engage with conventional stop-smoking interventions.
- **Flavours are essential to the appeal of ENDS as alternative to smoking.** The section on 'product characteristics' attempts to demonstrate a problem with flavours appealing to teenagers. In fact, flavours are integral to the appeal of ENDS to adults as an alternative to smoking. The citations are selective and findings misinterpreted and do not support this claim. Several citations simply reflect opinions or speculation, while important studies have been overlooked. These do not show that any interest amongst teenagers in ENDS flavours is resulting in regular use of ENDS in this age group.
- **Mischaracterisation of the ENDS market and role of tobacco transnationals.** The WHO paper misinterprets the ENDS market, makes misleading and unreferenced statements about the role of transnational tobacco companies in the market and is not grounded in an understanding of how competitive markets function. WHO's report fails to acknowledge the threat of disruptive technology such as ENDS to the commercial viability of the traditional cigarette business. Ironically, the only references given to published papers point out how regulations, such as those favoured by WHO, actually help the cigarette trade. WHO should be aware of the danger that its policy proposals may

provide the traditional tobacco industry with a twin advantage: (1) slowing down the disruption of the cigarette market by ENDS; (2) shaping the ENDS market to suit the ENDS business model favoured by the tobacco industry.

- **Unjustified support for ENDS prohibition.** In the discussion of policy options, the opening paragraph for each policy set implicitly endorses ENDS prohibition. It does this by stating that “Parties that have not banned the importation, sale, and distribution of ENDS/ENNDS may consider the following options”. Prohibition is one regulatory option among many that ought to be discussed on its own merits, not taken as a default. The merits of prohibition are exceedingly poor given the pervasive availability of cigarettes in all jurisdictions. WHO should not be endorsing prohibitions, explicitly or implicitly. It is unethical to deny smokers much lower risk options than cigarettes, and there is no scientific support for ENDS prohibition as a public health intervention. The WHO’s framing suggests that a prohibition is something for Parties to progress towards and should not be undone once done. In fact, it is a policy that should be reversed.
- **Policy proposals made with no supporting policy analysis.** Numerous policies are proposed without any supporting evidence for their effectiveness or cost-effectiveness. Any policy proposal should be subject to evidence-based justification, options appraisal and analysis of trade-offs or distributional effects, and impact assessment. Policies should be tested for proportionality and possible unintended consequences. The WHO has not applied any policy-making disciplines to its menu of proposed policy options.
- **No assessment of unintended consequences.** There is no recognition of the likelihood of ‘unintended consequences’ arising from the policies proposed in the WHO paper. However, it is very likely that some of the proposed policies would have the effect of increasing smoking. The Royal College of Physicians explains this in its 2016 [Nicotine without Smoke²](#) report as follows:

“A risk-averse, precautionary approach to e-cigarette regulation can be proposed as a means of minimising the risk of avoidable harm, e.g. exposure to toxins in e-cigarette vapour, renormalisation, gateway progression to smoking, or other real or potential risks. However, if this approach also

makes e-cigarettes less easily accessible, less palatable or acceptable, more expensive, less consumer friendly or pharmacologically less effective, or inhibits innovation and development of new and improved products, then it causes harm by perpetuating smoking. Getting this balance right is difficult.” (Section 12.10 page 187)

Almost every policy listed in the WHO’s paper could easily have the effect of protecting the incumbent cigarette trade, promoting smoking rather than vaping, and lead to increases in non-communicable diseases. It is very likely that widespread uptake of WHO’s policy proposal would ‘reduce harm reduction’ and therefore increase harm.

- **Transparency and quality.** *The WHO report has been made available without the four supporting papers upon which it is supposed to be based. These papers are still undergoing revision during peer review. This is poor scientific practice and does not provide a reliable basis for policy advice.*
